

Sprint Databasing

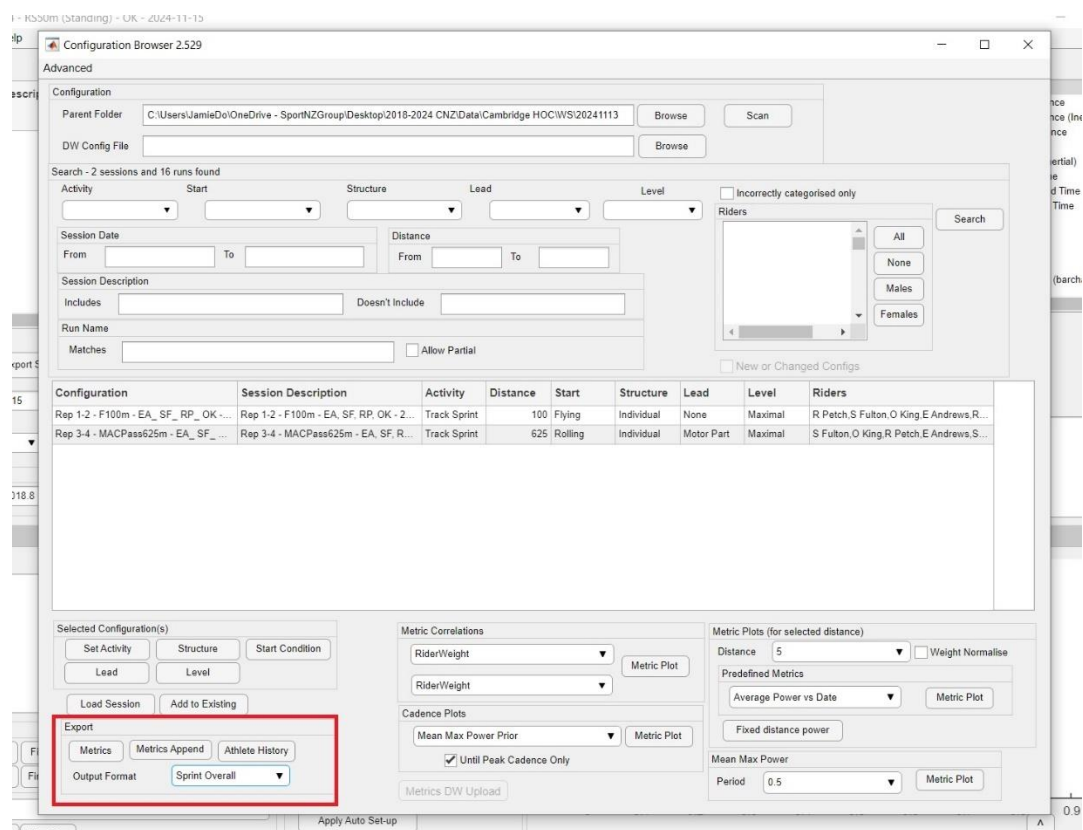

NB. Data capture is too big to put in a document, CNZ performance scientists will need to manage Goldmine data capture within Track sessions and upskill anyone else as required. S&Cs will need to manage data capture using TeamBuildr and GymAware within Gym sessions.

Overall comment on databasing captured data.

- I do this once a week for each database (e.g., after Friday track), but can do more frequently if want to look at something specifically on a given day.
- Generally, only one person should manage databases to ensure data integrity and safeguard against corrupting databases etc. Noting Katie uploads anthropometry data to the 'Testing Data – Track Sprint' database.
- Each data stream has sources of error through either user input error or technical measurement error, it's critical that the appropriate person who understands the data cleans this as required at the appropriate stage of data capture and databasing.

Goldmine

1. Open Clog Display.
2. Go to the "Configuration" drop down and open "Configuration Browser".
3. Scan Parent folder containing configs to be processed.
4. Ensure all selected configs are set up correctly (i.e., correct distance, start, structure etc).
5. Under 'Export' box in the bottom left is an "Output Format" drop down, select "Sprint Overall", no other settings change.
6. Select "Metrics" to export the metrics data, it will save as an excel file in the correct master database structure.
7. Review exported data and remove any anomalies (e.g., power spikes, incorrect times). This can be a bit of a job keeping on top off (by the way I spent over a month cleaning this database in 2019... probably worth keeping it clean).
8. Copy the exported data into the bottom of the 'Training Data – Track Sprint' database within SharePoint.

TeamBuildr

1. Will need an account with access to the sprint squad but Bill and possibly Fionn have admin privileges and can create a user account. It's a CNZ funded platform so no issues with access.
2. Open the TeamBuildr website.
3. From the landing page 'Dashboard' go to the "Coach Tools" dropdown and select "Reporting".
4. Select the "Raw Data" export at the bottom right.
5. Select "By Group" and "Sprint".
6. Select the "Completed Workouts" option for the required date range, ensure "Show External IDs" and "Show Tags" are turned on.
7. Select "Download Report" and it will export as an excel file.
8. Unfortunately, the table structure was changed a few months ago and now, "Tags" column needs to be moved and "Exercise ID" column deleted so the data table matches the "Teambuildr – Track Sprint" database, but this just takes a minute or two and then the data can be dropped into the master database.
9. It will be important for the S&C to manage data integrity and that the athletes have input everything correctly. In terms of general database management, it's important that the exercise names are consistent and managed by the S&Cs to allow multi-year and multi-practitioner comparisons.

The screenshot displays the TeamBuildr web application interface for generating a report. The browser address bar shows the URL <https://app-v3.teambuildr.com/reporting>. The navigation bar includes links for FEED, CALENDAR, WORKOUT TOOLS, COACH TOOLS, and SPRINT. The left sidebar contains a 'Filter' section with a 'CLEAR FILTER' button. Under 'Filter', there is a 'Select By Group' dropdown showing '1 group has been selected.' Below this is a search bar with the text 'sprint'. A list of groups is shown: 'Sprint' (selected), 'Development - Sprint', and 'Pre-HP Sprint Development Athletes'. The main panel is titled 'New Raw Data Report' and features a 'Select Data Set' section with three options: 'COMPLETED WORKOUTS' (selected), 'SPORT SCIENCE', and 'MAXES & HEALTH'. Below this is a 'Select Date Range' section with a date picker showing '11/10/2024' to '11/15/2024'. There are two checkboxes: 'Show External IDs' (checked) and 'Show Tags' (checked). A 'Show Advanced Workout Data' toggle is also present. At the bottom, there is a green button labeled 'DOWNLOAD REPORT'.

GymAware

1. Will need an account with access to the GymAware data, this will be trickier as it's the national HPSNZ database – an HPSNZ S&C should be able to do this, or maybe Keeno can approve Sam to access the database as an HPSNZ employee.
2. From the GymAware Cloud Pro website, at the top options bar select “Finder” and then “Reporter”.
3. From the Reporter page select “Bike Sprint” squad and the date range to be exported, select “Search”. The relevant sessions and lifts should appear.
4. Select Export, and the only setting to change is “Style” from ‘Tabular’ to ‘Columnar’.
5. Here's where it can be some work, you need to select the variables in the order they are presented in the “GymAware – Track Sprint” database. It gets changed each time a different S&C uses a different export structure; hence you will often need to set it up again for our data structure. Takes a few mins.
6. Once you've selected the appropriate variables in the correct order select “Export” and it will export as an excel document to be dropped into the master database.
7. It will be important for the S&C to manage data integrity and check for erroneous values (e.g., incorrectly entered weights, velocity spikes etc.). This can be a bit of a job keeping on top of.
